Sysmex CORE360™ CentralOps

Clarity in Every Operational Moment

Together for a better
healthcare journey

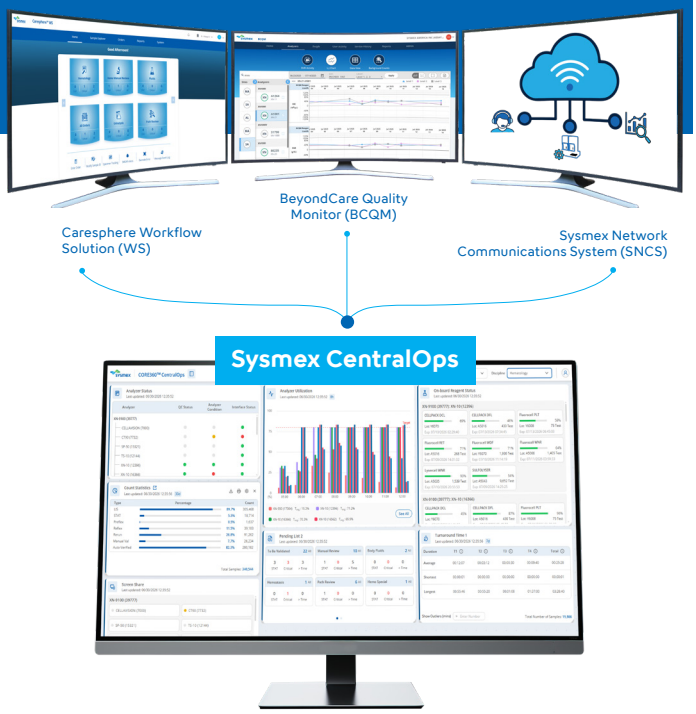

Operational Visibility for Today's Laboratory

Part of the Sysmex Informatics Ecosystem

CentralOps operates as the operational intelligence layer—integrating with solutions such as Caresphere™ Workflow Solution (CWS), BeyondCare℠ Quality Monitor (BCQM), and the Sysmex Network Communication System (SNCS)™.

This connected architecture supports a more cohesive view of laboratory workflows while allowing the platform to scale as operational needs evolve.

Laboratories are under increasing pressure to deliver faster results while managing staffing shortages, growing testing volumes, and rising quality expectations. Success depends on more than instrument performance—it requires real-time operational awareness across the laboratory. Yet gaining that level of visibility isn't always easy. It often requires multiple systems and manual effort just to piece together a complete picture.

A Smarter Way to See and Manage Your Lab

CentralOps is a centralized operational dashboard that provides laboratory leaders with a unified view of analyzer status, workflow performance, turnaround time, reagent availability, and operational activity across hematology, hemostasis and urinalysis. Instead of relying on multiple software applications, manual monitoring, and time-consuming bench walks, CentralOps brings critical operational information together in one connected experience.

With real-time operational visibility, laboratories can identify issues sooner, respond faster, and spend less time gathering information and more time taking action. By eliminating disconnected systems and manual checks, CentralOps helps laboratories stay ahead of workflow issues and keep operations running smoothly.

Complete Lab Visibility - From One Place.

CentralOps improves laboratory performance through five integrated capabilities, each supported by purpose-built views.

Centralized Visibility

One view across all instruments, disciplines, and sites

Workflow Intelligence

Real-time monitoring to catch bottlenecks before they impact TAT

Performance Insights

Operational data turned into actionable decisions

Operational Readiness

Proactive alerts for continuity risks before testing is affected

Connected Operations

Collaboration and staffing flexibility across locations

Analyzer Status

Monitor analyzer condition, QC status, and operational availability from one centralized view—accelerating response to issues.

Pending List

Identify aging samples and pending work before turnaround times are affected—highlighting bottlenecks and prioritizing work that needs attention.

Instrument Utilization

Understand analyzer utilization across instruments, disciplines, and laboratory sites—balancing workload and identifying capacity constraints.

Screen Sharing

Provide remote support across connected laboratory locations—extending expert support, improving staffing flexibility, and reducing travel between sites.

Count Statistics

Track laboratory workload, throughput, and operational performance from a centralized dashboard to support informed management decisions.

Turnaround Time

Visualize TAT performance across multiple workflow segments to understand where delays occur and support targeted process improvement.

Reagent Status

Monitor onboard reagent availability and identify operational risks before testing is affected—helping prevent stockouts and expiring reagents.
